Utensili per foratura e filettatura

Punte in metallo duro Supradrill® U

- Lavorazione universale di acciai. Foratura affidabile di acciai e acciai inox
- Assortimento completo per una vasta gamma di componenti e applicazioni. L'assortimento di base comprende 3 x D e 5 x D con raffreddamento interno centralizzato e la variante 5xD senza raffreddamento interno centralizzato
- Strato ad alte prestazioni Nano-U^2: il rivestimento più efficiente per la foratura universale in acciaio
- Maggiore sicurezza del processo, maggiore durata e riduzione dei costi di produzione. Grazie al sistema a strati di sviluppo FRAISA e alla conformazione del tagliente adattata alle dimensioni

SUPRADRILL® U

Frese a filettare

- Grande sicurezza di processo nella realizzazione di filettature interne con profondità di foro fino a 3 x D
- Vasto assortimento di frese a filettare e frese a forare e filettare per un'efficiente realizzazione di filettature M, MF, G, UNC, UNF, NPT e NPTF
- Costi utensile ridotti grazie ad un impiego universale in svariati materiali e passo uguale
- Essendo corti, i trucioli non restano incastrati nella filettatura. Velocità di taglio e di avanzamento selezionabili indipendentemente l'una dall'altra

FRESE A FILETTARE

Maschi x-tap

- Maschi per la lavorazione ad alte prestazioni di acciaio e acciaio inox
- Elevata sicurezza del processo a coppia ridotta e durate elevate
- Disponibile ampia varietà di tipi di filettatura per una vasta gamma di applicazioni. Con un sistema di codificazione per garantire la giusta scelta degli utensili e dati d'impiego
- Strato in materiale duro TRIBO: per la lavorazione affidabile di acciaio inox

X-TAP

Sostituisce l'edizione 2019/20

passion
for precision
fraisa

FRAISA vi offre dei prodotti altamente innovativi. Prodotti che sono sempre all'alteza degli sviluppi tecnologici e spesso ne rappresentano addirittura la massima espressione.

Con **«i suggerimenti della ToolSchool»** vogliamo illustrarvi le tecnologie di volta in volta più aggiornate e apprezzate comprese nel nostro catalogo e naturalmente i loro vantaggi.

«I suggerimenti della ToolSchool» vi dimostreranno con chiarezza come passare da prodotti finora impiegati a nuove soluzioni. Nel catalogo, con il logo ToolSchool contrassegniamo i prodotti selezionati per i quali proporre un upgrade dalle tecnologie già esistenti a quelle più aggiornate e apprezzate.

Il passaggio da «già esistente» a «nuovo» vi consentirà di incrementare la produttività e ridurre i costi assicurandovi più vantaggi sul mercato nel confronti della concorrenza.

Grazie a ToolSchool potrete contare sempre sulle più aggiornate e apprezzate tecnologie.
Questo vi permetterà di rafforzare la vostra posizione rispetto alla concorrenza.

In FRAISA, ToolSchool è sinonimo di esperienza pluriennale ampiamente collaudata e di grande perizia in fase di applicazione ma ToolSchool significa anche fondato know-how applicativo e vantaggi per il cliente.
Su questo potete avere assoluta certezza.

La più aggiornata e apprezzata tecnologia FRAISA per

- **più efficienza**
- **meno costi**
- **migliore competitività sul mercato**

A questo catalogo si aggiunge un opuscolo presenta in modo chiaro i suggerimenti di ToolSchool sulla base di una panoramica degli utensili.

Legenda riguardante la pagina dei prodotti degli utensili per foratura

Tecnologie degli utensili

Punte con quattro smussi (due smussi d'attrito e due smussi guida)
- Miglioramento rettilineità del foro
- Migliore qualità del foro e migliore allineamento
- Minori deviazioni del foro nell'intersezione con fori trasversali
- fori di ottima concentricità, buona superficie; massimo supporto dell'utensile in uscita dal foro

Punte con scanalature di scarico trucioli ottimizzate e lucidate e con adduzione interna del refrigerante
- Riduzione attrito (e quindi meno tendenza all'adesione), migliore evacuazione del truciolo e minore riscaldamento

Punte con scanalature di scarico trucioli ottimizzate e lucidate, senza adduzione interna del refrigerante
- Riduzione attrito (e quindi meno tendenza all'adesione), migliore evacuazione del truciolo e minore riscaldamento

Punte con gambo di presa in qualità h5
- Elevata precisione di concentricità ed eccentricità
- Ottima per le moderne attrezzature di serraggio di precisione

Materiali per utensili

HM XA

Metallo duro micrograna. Durezza 1950 HV. Contenuto di cobalto 8%. Si distingue particolarmente per l'elevata resistenza all'usura (Abrasion).

HM MGX

Metallo duro micrograna ad alto rendimento con carburo di tungsteno ultrafine. Durezza 1610 HV. Contenuto di cobalto 10%.

HM MG10

Metallo duro micrograna. Durezza 1600 HV. Contenuto di cobalto 10%.

HM MGD²

Metallo duro micrograna con caratteristiche di elevata resistenza a flessione e al taglio in condizioni di buona elasticità.

HM

Metallo duro micrograno, universale.

HSS

Materiale per utensili ad alto rendimento. Lega ASR prodotto con metallurgia convenzionale.

Legenda riguardante la pagina dei prodotti degli utensili per foratura

Adduzione refrigerante

Le punte con adduzione interna del refrigerante danno migliore formazione ed evacuazione del truciolo assicurando maggior sicurezza di processo e durata utensile.

Punte senza adduzione interna refrigerante.

Angolo alla sommità ed inclinazione dell'elica

Il valore dell'angolo di testa influenza in modo determinante la gamma di materiali lavorabili. Angoli minori facilitano il centraggio mentre angoli maggiori riducono la coppia.

L'inclinazione dell'elica incide in modo determinante sulla spoglia principale (estremità della punta). Grandi inclinazioni si addicono ai materiali teneri, piccole inclinazioni ai materiali secchi e duri.

Esecuzioni e dimensioni delle punte elicoidali

Punte elicoidali in metallo duro, 3xd
Le dimensioni di questo utensile rispondono alla norma DIN 6537 K «Punte elicoidali in metallo duro con gambo cilindrico ribassato».

Punte elicoidali in metallo duro, 5xd
Le dimensioni di questo utensile rispondono alla norma DIN 6537 L «Punte elicoidali in metallo duro con gambo cilindrico ribassato».

Punte elicoidali in metallo duro e punte per foratura profonda, lunghezza maggiore di 5xd.
Secondo lo standard aziendale.

Punte elicoidali in metallo duro lunghezza 8xd, ottimizzate; secondo norma aziendale ma con rapporto l/d ottimizzato per la max stabilità dell'utensile.

Esecuzioni e dimensioni speciali

90°

Indicazione dell'angolo al vertice per punte da centro o punte per intestatura conica.
Punte per svasatura a 90° DIN 335

Profondità di foratura

Dati della profondità nominale di foratura. (Esempio: 5xd = 5 volte il diametro).
La profondità nominale di foratura non corrisponde alla profondità massima! La profondità massima di foratura dell'utensile è indicata con L_{max}.

Legenda riguardante la pagina dei prodotti degli utensili per foratura

Forma del gambo / Esecuzioni del gambo

Utensili per metallo duro con gambo cilindrico: esecuzione gambo ai sensi della norma DIN 6535 HA

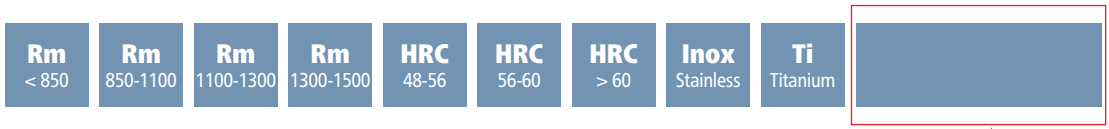
Utensili per metallo duro con gambo cilindrico e superficie di serraggio laterale: esecuzione gambo ai sensi della norma DIN 6535 HB

Micropunta per metallo duro e punte per foratura profondi con gambo cilindrico: esecuzione gambo secondo gli standard aziendali.

Idoneita alla lavorazione

Lo sfondo blu indica l'eccezionale adeguatezza dell'utensile a questo materiale.

Lo sfondo azzurro indica un'adeguatezza da buona a sufficiente dell'utensile a questo materiale.



Nel campo aggiuntivo sono indicati gli altri materiali che è possibile lavorare

Abbreviazioni

d_1	Diametro dei taglienti [mm]
d_2	Diametro del gambo [mm]
d_3	Diametro della superficie frontale di frese a svasare [mm]
l_1	Lunghezza totale dell'utensile [mm]
l_2	Lunghezza della scanalatura per i trucioli [mm]
l_3	Lunghezza del 2° gradino (punte a gradini) [mm]
l_4	Lunghezza del gambo [mm]
L_{max}	Profondità massima di foratura dell'utensile
L_K	Profondità di foratura per smusso (Punte a gradini)

Lubrorefrigerazione e pressione del refrigerante

Di regola la foratura avviene con lubrorefrigerante. Obiettivi sono l'efficiente evacuazione del truciolo e del calore. Acciai temperati o materiali abrasivi possono essere forati anche a secco (raffreddamento con aria) o con MMS (lubrificazione minimale). Se il liquido di raffreddamento perviene dall'esterno occorre fare attenzione al corretto posizionamento del getto. Questo dovrebbe essere diretto parallelamente all'angolo d'elica e sull'ingresso del foro.

Con uso di una erogazione interna del lubrorefrigerante (attraverso mandrino e utensile) si ottengono superiori prestazione e una maggiore vita dell'utensile. In questo caso, in funzione dell'esecuzione e del diametro dell'utensile, occorre una determinata pressione minima del fluido refrigerante.

La seguente tabella fornisce valori orientativi del lubrorefrigerante raccomandati da Fraisa per punte con erogazione interna del fluiido:

Pressione di refrigerante richiesta per punte elicoidali con erogazione interna dl fluido						
Esecuzioni	< ø 3 mm	ø 3-5 mm	ø 5-8 mm	ø 8-12 mm	ø 12-16 mm	ø 16-20 mm
fino a 5xd	60 bar	50 bar	30 bar	25 bar	20 bar	15 bar
8xd – 30xd	80 bar	60 bar	40 bar	30 bar	25 bar	20 bar
Pressione di refrigerante richiesta per punte a elica con erogazione interna e lubrificazione minimale						
Esecuzioni	< ø 3 mm	ø 3-5 mm	ø 5-8 mm	ø 8-12 mm	ø 12-16 mm	ø 16-20 mm
fino a 5xd	12 bar	10 bar	9 bar	8 bar	8 bar	7 bar
8xd – 30xd	14 bar	12 bar	10 bar	9 bar	9 bar	8 bar

Concentricità

La concentricità di rotazione nel processo di foratura è una grandezza molto importante. L'eccentricità deve essere la più piccola possibile poiché influenza fortemente lo sviluppo dell'usura. La concentricità di rotazione dovrebbe essere controllata soprattutto con i diametri di foro sotto 6 mm. La misura di controllo va effettuata a utensile montato e serrato nel portautensile o nel mandrino della macchina.

La seguente tabella fornisce un orientamento per l'errore di concentricità massimo, secondo Fraisa:

Eccentricità massima di punte elicoidali						
Campo di diametri	< ø 1 mm	ø 1-3 mm	ø 3-6 mm	ø 6-10 mm	ø 10-16 mm	ø 16-20 mm
Eccentricità massima	3 µm	5 µm	10 µm	15 µm	20 µm	25 µm

Centraggio e foro pilota

La punta deve essere sempre perpendicolare al pezzo. In caso di foratura su una superficie inclinata è necessario prevedere una superficie ausiliaria perpendicolare alla punta per foratura.

L'angolo al vertice della punta da centro deve essere sempre più grande dell'angolo al vertice della punta elicoidale. Così, si ha un centraggio ottimale della punta a forare e minore usura.

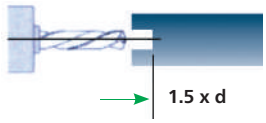
Raccomandazioni Fraisa circa centraggi e fori pilota:

Esecuzioni	**Mat. per utensili**	**Raccomandazione**
fino a 5xd	Metallo duro	No
fino a 5xd	ASR	Sì
8xd	Metallo duro	Opzione: Un miglioramento della cilindricità può essere ottenuto mediante centraggio.
12xd – 30xd	Metallo duro	Sì, un foro pilota è necessario (vedere a pagina 428)

Istruzioni tecniche per l'impiego delle punte per foratura profonda

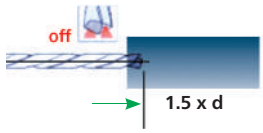
Allo scopo di aumentare la durata e l'affidabilità di questo di tipo di punte, Fraisa SA suggerisce di adottare la seguente tecnica di foratura:

Fase 1



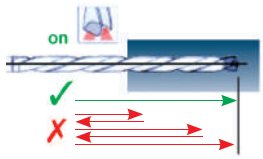
Esecuzione del foro pilota = 1.5 x d.
Ad esempio con Supradrill® U 3xd. B62011.
Il foro pilota dovrà essere pulito, libero da trucioli, prima dell'usi della punta per fori profondi!

Fase 2



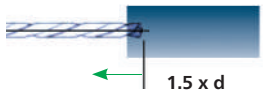
Introdurre la punta per fori profondi nel foro con numero di giri massimo di 300 1/min e avanzamento v_f = 1000mm/min, senza refrigerante fino ad 1 mm dal fondo del foro pilota.

Fase 3



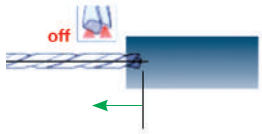
Alimentazione refrigerante ins.
Perforare senza rottura truciolo con dati di taglio consigliati.
In caso di perforazione per realizzare **fori passanti**, ridurre l'avanzamento di almeno il 25% prima che la punta esca dal foro.

Fase 4



Trattandosi di punte per fori profondi, arretrare con doppio avanzamento (=2 x v_f) – fino a 1,5 x d dopo l'entrata nel foro.
Posizione come nell'operazione 2.

Fase 5



Ridurre quindi la velocità a un massimo di 300 giri/min.
Estrarre la punta dal foro. (max. 1000 mm/min).

AVVERTENZA DI SICUREZZA

Le punte per fori profondi lunghe possono essere fatte ruotare libere, al di fuori del foro soltanto a basso numero di giri (max. 300 1/min).
Velocità maggiori possono generare vibrazioni tali da portare ad una loro rottura spontanea.

Formule di calcolo per i parametri di taglio

d_1 Diametro dei taglienti [mm]

v_c Velocità di taglio [m/min]

f Avanzamento per giro [mm]

n Velocità di rotazione [min^{-1}]

v_f Velocità di avanzamento [mm/min]

Q Volume di truciolatura [cm^3/min]

T Tempo macchina di lavorazione per la profondità massima di perforazione dell'utensile [sec]

L Profondità di foratura effettiva [mm]

Velocità di rotazione	$n = \frac{v_c \cdot 1000}{d_1 \cdot \pi}$	$\left[\frac{1}{min}\right]$
Velocità di taglio	$v_c = \frac{d_1 \cdot n \cdot \pi}{1000}$	$\left[\frac{m}{min}\right]$
Velocità di avanzamento	$v_f = f \cdot n$	$\left[\frac{mm}{min}\right]$
Volume di truciolatura	$Q = \frac{d_1^2 \cdot \pi \cdot v_f}{4 \cdot 1000}$	$\left[\frac{cm^3}{min}\right]$
Tempo macchina di lavorazione	$T = \frac{L}{v_f} \cdot 60$	[sec]

Classe d'applicazioni / Posizioni della tolleranza

ISO 2 (6H)	Gli utensili della classe applicativa 2 (ISO 2) sono concepiti per la generazione di filettature nei campi di tolleranza 4G, 5G, 6H.
ISO 1 (4H)	Gli utensili della classe applicativa 1 (ISO 1) sono concepiti per la generazione di filettature nei campi di tolleranza 4H, 5H.
ISO 3 (6G)	Gli utensili della classe applicativa 3 (ISO 3) sono concepiti per la generazione di filettature nei campi di tolleranza 6G, 7H, 8H.
7G	Gli utensili della classe applicativa 7G sono concepiti per la generazione di filettature nei campi di tolleranza 7G, 8G con successivo trattamento di tempra con deformazioni.
ISO 2 +0,1	Gli utensili della classe applicativa 2 (ISO 2) sono concepiti per la generazione di filettature nei campi di tolleranza 4G, 5G, 6H. A scopo di successivo trattamento galvanico superficiale delle filettature con spessore di riporto di 0.025 mm, gli utensili sono concepiti con tolleranza maggiorata di 0.1 mm sulla filettatura.
4H	Gli utensili della classe applicativa 4H sono concepiti per la generazione di filettature MJ nei campi di tolleranza 4H (ASME B1.1).
2B	Gli utensili della classe applicativa 2B sono concepiti per la generazione di filettature nei campi di tolleranza 2B.
3B	Gli utensili della classe applicativa 3B sono concepiti per la generazione di filettature nei campi di tolleranza 3B.
6H mod	Gli utensili della classe applicativa 6H sono concepiti per la generazione di filettature per inserti.

Materiali per utensili

HSS PM/F	ASR di alta resa per utensili, da metallurgia delle polveri.
HSS-E Co5	Materiale per utensili di alte prestazioni. Prodotto con metallurgia convenzionale ma con contenuto di cobalto dell'5%.
HM MG10	Metallo duro micrograno, universale, durezza 1600 HV, contenuto di Co 10%.
HM	Metallo duro micrograno, universale.

Legenda riguardante la pagina dei prodotti degli utensili per filettatura

Norma di filettatura

I fianchi dell'utensile rispondono alle norme indicate sotto «Tipi di filettatura».

Forma del gambo

Esecuzione cilindrica del gambo secondo la norma indicata.

Esecuzione cilindrica del gambo con spianatura laterale secondo la norma indicata.

Esecuzione cilindrica del gambo con quadro secondo la norma indicata.

Esecuzione cilindrica del gambo con quadro secondo la norma specificata.

Esecuzione cilindrica del gambo con quadro.

Forme di foro

I fori da maschiare devono avere il giusto diametro.
(Regola empirica della maschiatura: Diametro foro = Diametro interno filettatura – passo)

Utensile adatto alla filettatura di fori ciechi.

Utensile adatto alla filettatura di fori passanti.

Utensile adatto alla filettatura di fori ciechi e fori passanti.

Utensile adatto alla generazione di fori conici ciechi e fori conici passanti.

Legenda riguardante la pagina dei prodotti degli utensili per filettatura

Forme d'imbocco / Forme d'imbocco coniche

Forme d'imbocco per maschi DIN 2197, Tabella 4: Tipo B.
Il numero di passi sull'imbocco varia da 3.5 a 5.

Forme d'imbocco per maschi DIN 2197, Tabella 4: Tipo C.
Il numero di passi sull'imbocco varia da 2 a 3.
Forma conica d'imbocco per maschi a rullare DIN 2175, Tabella 4: Tipo C.
Lunghezza del cono d'imbocco: 2 - 3 passi.

Forma conica d'imbocco per maschi a rullare DIN 2175, Tabella 4: Tipo E.
Lunghezza del cono d'imbocco: max. 2 passi.

Scarico trucioli

Utensile con scarico trucioli in direzione avanzamento.

Utensile con scarico trucioli in direzione contraria a quella di avanzamento.

Utensile per materiali a truciolo corto.

Maschi a rullare

Utensile con profilo poligonale senza cave di lubrificazione.

Utensile con profilo poligonale con cave di lubrificazione.

Frese a filettare

Utensile per filettature interne.

Utensile per filettature esterne.

Legenda riguardante la pagina dei prodotti degli utensili per filettatura

Idoneita alla lavorazione

Lo sfondo blu indica l'eccezionale adeguatezza dell'utensile a questo materiale.

Lo sfondo azzurro indica un'adeguatezza da buona a sufficiente dell'utensile a questo materiale.

Rm < 850	Rm 850-1100	Rm 1100-1300	Rm 1300-1500	HRC 48-56	HRC 56-60	HRC > 60	Inox Stainless	Ti Titanium	

Nel campo aggiuntivo sono indicati gli altri materiali che è possibile lavorare

Lubrorefrigeranti

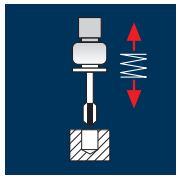
Per la filettatura con maschi, e in particolare con maschi a rullare, va assicurata un'adeguata lubrificazione. Più profonda è la filettatura, tanto più importante è la lubrificazione.

Nella maschiatura si ottengono i migliori risultati con olio (effetto lubrificante). E però possibile anche la lavorazione con emulsione minimo al 5%.

Per la lavorazione è necessario olio come lubrificante.

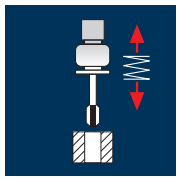
Per la lavorazione è necessario olio con additivi speciali come lubrificante.

Definire il diametro del foro secondo la colonna Mat. Critico, pagina 445.

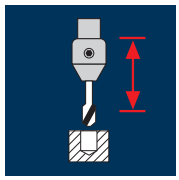


Maschiatura con mandrino di compensazione

Deve essere garantita una buona funzione di compensazione del mandrino (nessun blocco). In caso contrario, nonostante il mandrino di compensazione la filettatura potrebbe tagliarsi scorrettamente oppure potrebbero verificarsi degli errori di passo. La forza di trazione del mandrino di compensazione lineare deve essere scelta in funzione della filettatura da realizzare e del materiale da lavorare.

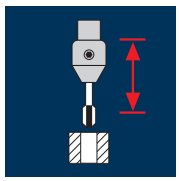


La programmazione di un numero di giri troppo elevato può dare problemi. Se il numero di giri è programmato in modo che non possa essere raggiunto (a causa del ritardo del movimento della macchina), può verificarsi una rottura prematura dell'utensile o il taglio scorretto della filettatura. Ad un'osservazione precisa, risulta che un numero di giri elevato non apporta spesso il risparmio di tempo auspicato.



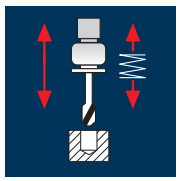
Rigid Tapping

Rigid Tapping - maschiatura rigida viene utilizzato per macchine moderne con guida sincronizzata. Tutti gli utensili dispongono di superficie laterale di serraggio e sono impiegati in pinze convenzionali.

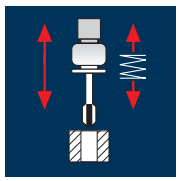


Nel taglio delle filettature con Rigid Tapping occorre programmare una distanza di sicurezza sufficiente. Se la distanza di sicurezza è insufficiente, il mandrino della macchina potrebbe non girare in sincronia con l'avanzamento prima di entrare nel foro. La conseguenza sono errori di passo della filettatura anche se si lavora in modo sincronizzato.

In diverse macchine non è possibile raggiungere la velocità di rotazione raccomandata nel funzionamento sincrono. In questi casi é necessario operare con il numero dei giri massimi dove la sincronizzazione della macchina é ancora garantita.



Maschiatura con compensazione lunghezza oppure Rigid Tapping



Istruzioni tecniche per l'impiego degli utensili per filettatura

Incrudimento del foro
Durante la foratura assicurarsi di utilizzare una punta adatta e intatta. Se l'usura della punta è troppo elevata, potrebbe formarsi un indurimento della zona marginale. Una della conseguenze di questo indurimento può essere la rottura dell'utensile per maschiare.

Indurimento e rifinitura della svasatura
Per la preparazione del foro devono essere utilizzati degli utensili buoni e adatti al materiale. Se lo svasatore è troppo usurato, la svasatura si indurisce od è ricalcata. In questo modo l'utensile per maschiare incontra dei problemi già nella prima fase di taglio. Questo può provocare rotture all'imbocco. La svasatura è importante per guidare l'utensile per maschiare.

Filettatura profonda
Per le filettature profonde devono essere utilizzati utensili con scanalature sufficientemente lunghe. In caso contrario l'utensile potrebbe rompersi in seguito all'accumulo di trucioli poiché questi ultimi non possono fuoriuscire dal foro. Nel Rigid Tapping è possibile lavorare con diversi avanzamenti di profondità per accorciare i trucioli. È importante che il raffreddamento sia sufficiente.

Funzionalità del mandrino di compensazione
Deve essere garantita una buona funzione di compensazione del mandrino (nessun blocco). In caso contrario, nonostante il mandrino di compensazione la filettatura potrebbe tagliarsi scorrettamente oppure potrebbero verificarsi degli errori di passo. La forza di trazione del mandrino di compensazione lineare deve essere scelta in funzione della filettatura da realizzare.

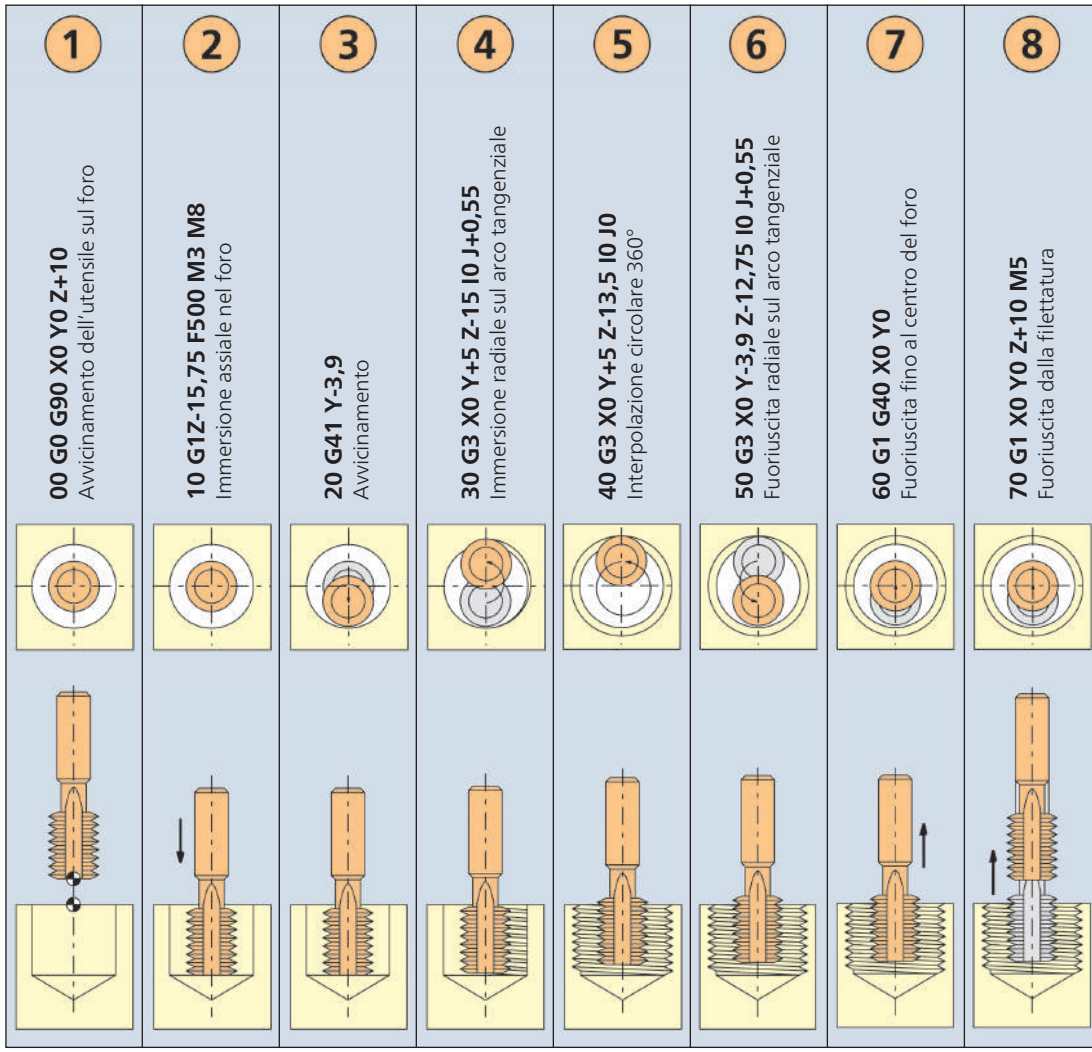
Getto di raffreddamento orientato in modo corretto
Nel taglio delle filettature è importante che il getto di raffreddamento sia orientato in modo corretto. L'allineamento deve essere eseguito dall'alto in direzione delle scanalature di serraggio affinché il raffreddamento sia efficace anche in profondità. Se il getto di raffreddamento non è orientato in modo corretto, all'interno del foro si forma del calore con il conseguente problema della saldatura a freddo del materiale. Tutto ciò può provocare una minore durata utile e una pessima formazione di trucioli.

Distanza di sicurezza
Nel taglio delle filettature con Rigid Tapping occorre programmare una distanza di sicurezza sufficiente. Se la distanza di sicurezza è troppo corta, il mandrino della macchina potrebbe non giare in sincronia con l'avanzamento prima di entrare nel foro. La conseguenza sono errori di passo della filettatura anche se si lavora in modo sincronizzato.

Idoneità della macchina
In diverse macchine esiste la possibilità che il numero di giri consigliato non possa essere raggiunto. In questo caso occorre programmare di conseguenza il numero di giri della macchina.

Numero di giri non costante
La programmazione di un numero di giri troppo elevato può dare problemi: se il numero di giri è programmato in modo che non possa essere raggiunto (a causa del ritardo del movimento della macchina), può verificarsi una rottura prematura dell'utensile o il taglio scorretto della filettatura. Ad un'osservazione precisa, risulta che un numero di giri elevato non apporta spesso il risparmio di tempo auspicato.

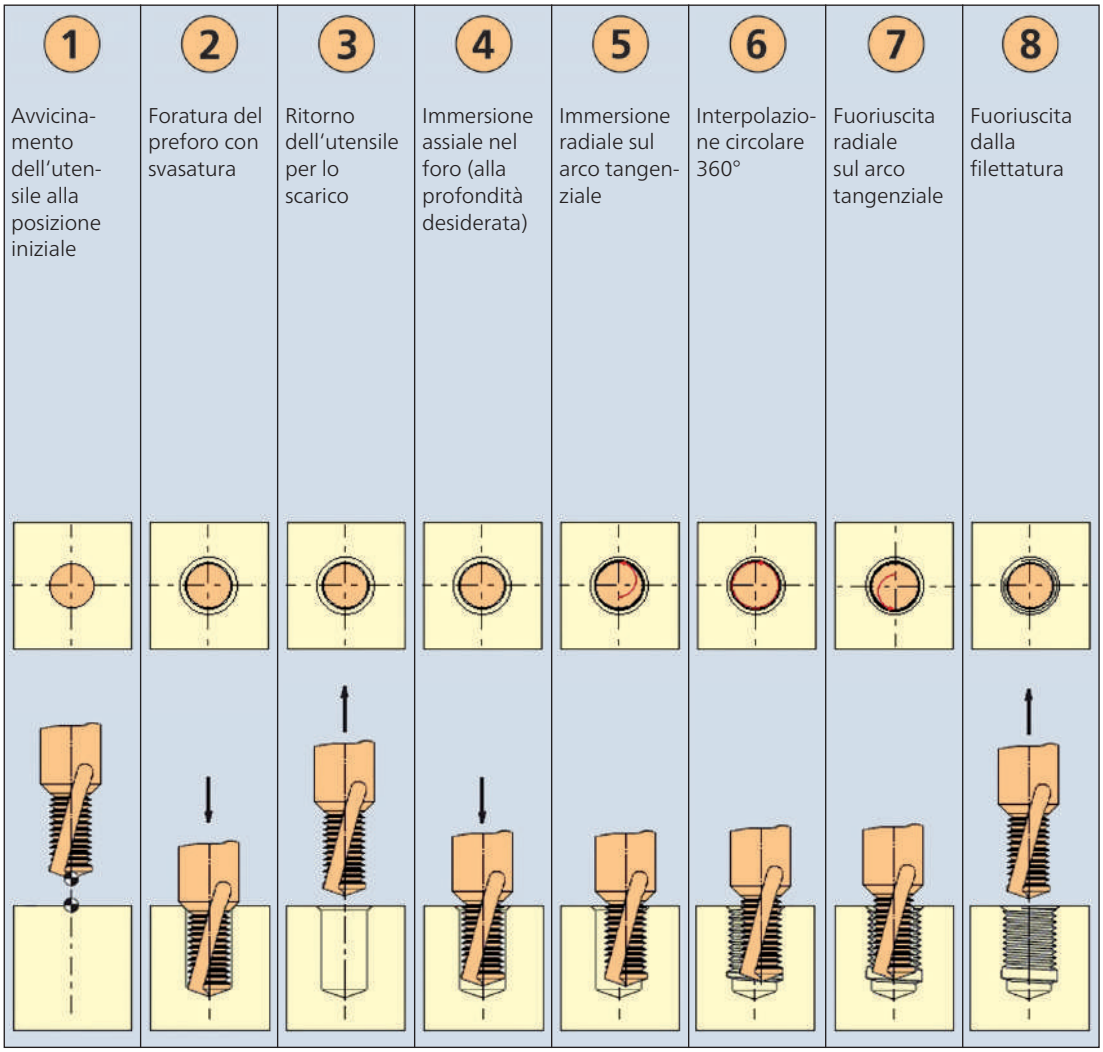
Ciclo di fresatura del filetto per M10 in codice ISO come esempio



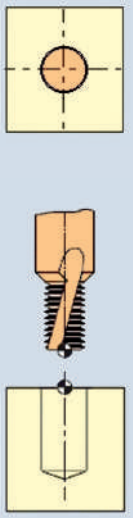
Significato dei comandi G e M impiegati

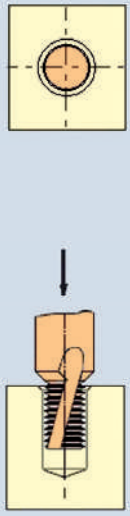
G0	G1	G3	G40	G41	G90	G91	M3	M5	M8	M9
Movimento lineare in rapido	Movimento lineare con avanzamento F in mm/min	Interpolazione arco di cerchio con centro (I,J)	Sopprimere la correzione del raggio utensile	Correzione raggio utensile (utensile a sinistra del contorno)	Programmazione con quote assolute	Programmazione incrementale	Mandrino ON (rotazione a destra)	Mandrino OFF	Raffreddamento ON	Raffreddamento OFF

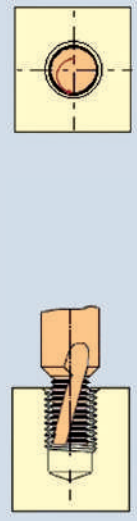
Ciclo di fresatura del filetto per la fresatura a forare e filettare

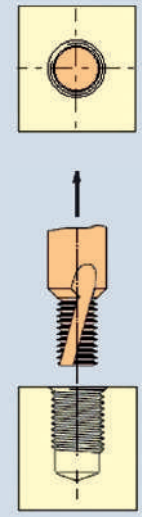


Ciclo di fresatura per frese a filettare (direzione di lavorazione consigliata: controdirezionale)

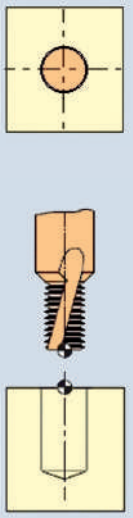
1	2	3	4	5	6
Avvicinamento dell'utensile sul foro	Lasciare l'utensile nella posizione di inizio della fresatura a filettare	Immersione radiale sul arco tangenziale	Interpolazione circolare 360°	Fuoriuscita radiale sul arco tangenziale	Fuoriuscita dalla filettatura
					


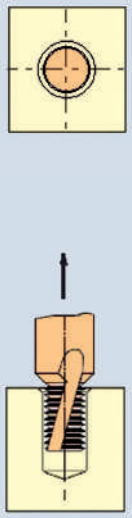


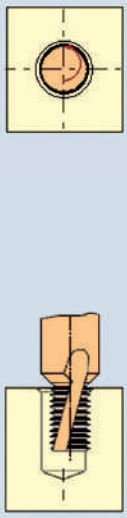


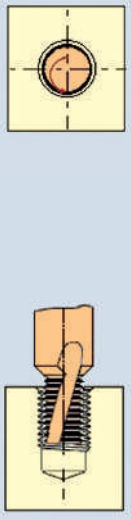


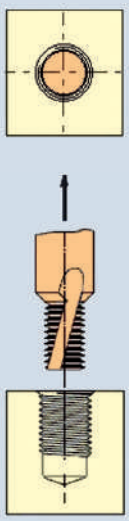
Ciclo di fresatura del filetto per frese a filettare con smusso

1	2	3	4	5	6	7
Avvicinamento dell'utensile sul foro	Svasatura dello smusso di 90°	Lasciare l'utensile nella posizione di inizio della fresatura a filettare	Immersione radiale sul arco tangenziale	Interpolazione circolare 360°	Fuoriuscita radiale sul arco tangenziale	Fuoriuscita dalla filettatura
						


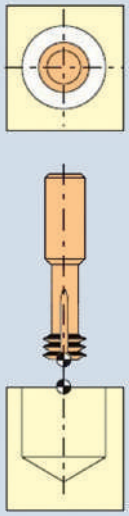


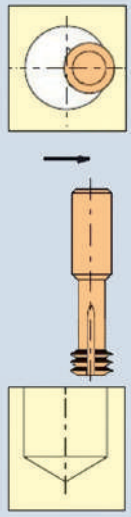


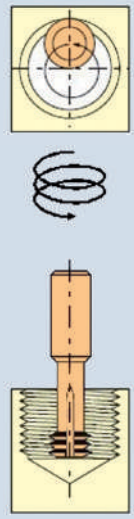


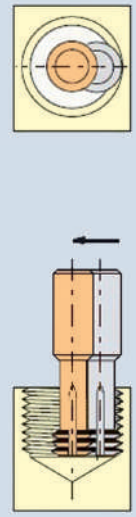


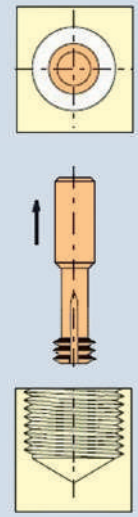
Ciclo di fresatura del filetto per frese a filettare con smusso (direzione di lavorazione consigliata)

1	2	3	4	5
Avvicinamento dell’utensile sul foro	Avanzamento radiale	Filettatura mediante interpolazione elicoidale (alla profondità desiderata)	Estrazione radiale	Fuoriuscita dalla filettatura
				


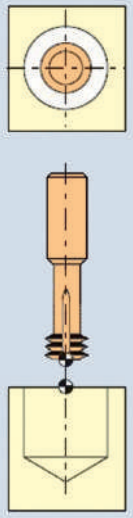


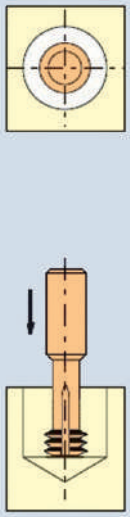


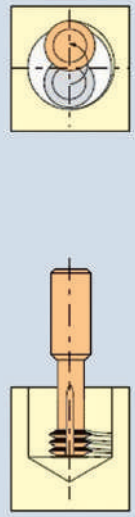


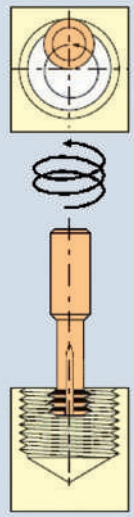


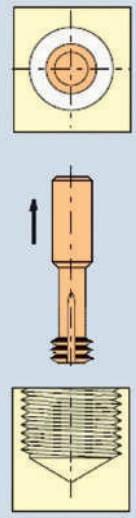
Ciclo per filettatura destra concordanza con utensile per turbofilettatrice

1	2	3	4	5
Avvicinamento dell'utensile sul foro	Immersione assiale nel foro (alla profondità desiderata)	Immersione radiale sul arco tangenziale	Filettatura mediante interpolazione elicoidale	Fuoriuscita dalla filettatura
				


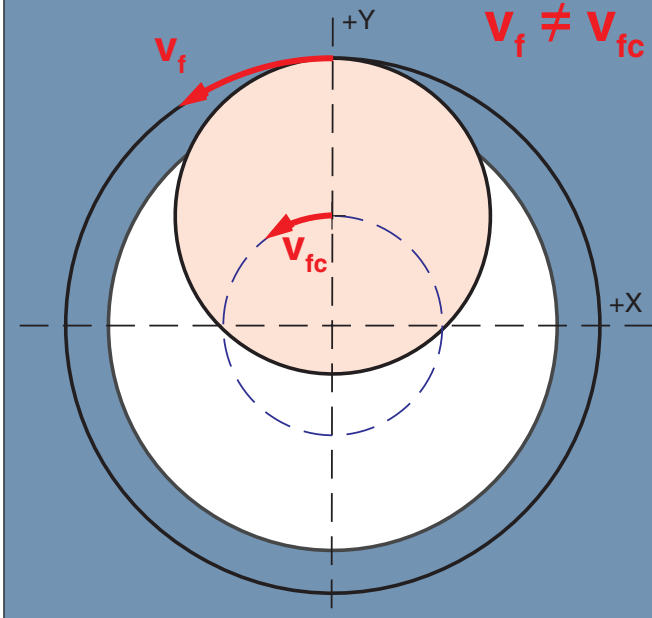








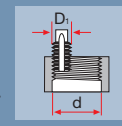
Definizione della velocità di avanzamento



Diametro nominale della filettatura d

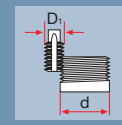
Conversione della velocità di avanzamento desiderata sul pezzo da lavorate v_f, in velocità d'avanzamento da programmare v_{fc} sul centro dell'utensile:

Per filetto interno



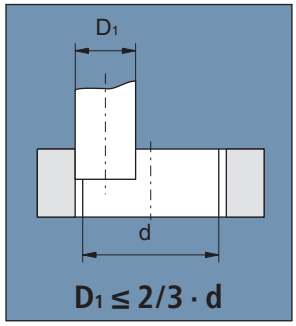
$$v_{fc} = \frac{v_f \cdot (d - D_1)}{d}$$

Per filetto esterno



$$v_{fc} = \frac{v_f \cdot (d + D_1)}{d}$$

Come evitare distorsioni del profilo



Per evitare distorsioni del profilo, il diametro della fresa D_1 deve essere massimo i 2/3 del diametro di nocciolo della madrevite d.

Il sovrametallo del foro da maschiare deve essere da 0.1 a 0.3 mm.

In questo modo il filetto viene fresato senza problemi.

Formule e abbreviazioni

a	Dimensioni del quadro
d	Diametro nominale filettatura
d_1	Diametro del gambo
d_2	Diametro di foratura della fresa per forare e filettare
D_1	Diametro della fresa a filettare
d/D_1	Rapporto del diametro per la determinazione della velocità di avanzamento
Rk	Raggio di fresatura corretto per tolleranza del dado 6H / ISO2 (da programmare nella memoria dell'utensile)
f_z	Avanzamento per dente
l	Lunghezza della parte filettata dei maschi / maschi a rullare
l_1	Lunghezza del collarino dei maschi / maschi a rullare o lunghezza complessiva delle frese a filettare
l_2	Lunghezza della parte filettata delle frese a filettare
l_3	Lunghezza delle scanalature dei maschi o lunghezza del collarino delle frese a filettare
L	Lunghezza complessiva dei maschi / maschi a rullare
L_K	Profondità dello smusso nella fresa a filettare con smusso
n	Velocità di rotazione
P	Passo filettatura
v_c	Velocità di taglio
v_f	Velocità di avanzamento
v_{fc}	Velocità di avanzamento del centro utensile
	Numero di denti dei maschi e delle frese a filettare
	Numero di spigoli a rullare per maschi a rullare
Δ	Differenza tra diametro fianchi filettatura, diametro esterno filettatura e diametro nucleo filettatura per la classe d'impiego 2 (ISO 2) secondo DIN 22857.
R_m	Resistenza meccanica a trazione
HRC	Durezza Rockwell C
HV	Durezza Vickers
HB	Durezza Brinell

Velocità di rotazione	$n = \frac{v_c \cdot 1000}{d_1 \cdot \pi}$	$\left[\frac{1}{min}\right]$
Velocità di taglio	$v_c = \frac{d \cdot \pi \cdot n}{1000}$	$\left[\frac{m}{min}\right]$
Velocità di avanzamento Maschi	$v_f = P \cdot n$	$\left[\frac{mm}{min}\right]$
Velocità di avanzamento Frese a filettare	$v_f = f_z \cdot z \cdot n$	$\left[\frac{mm}{min}\right]$
